1. Introduction

In this chapter you can read about:

Device assignment	5
Type specification plate	5
Mounting explanation	6
Safety instructions	7
Packaging, storage, transport	9
Warranty conditions	11
Conditions of utilization	11

1.1 Device assignment

This manual is valid for the following devices:

Electro cylinder for motors and gearboxes:

- ◆ ETH032
- ◆ ETH050
- ◆ ETH080

1.2 Type specification plate

Type specification plate (example)

	Serial number: 285950-0001 Type: ETH050M05A1K1AFMN0200A Order confirmation No.: 21015463 Date: 02.11.2010 Made in Germany

EINBAUERKLÄRUNG DECLARATION OF INCORPORATION

ACCORDING TO EC DIRECTIVE 2006/42/EC (ANNEX II, PART 1, SECTION B) FOR PARTLY COMPLETED MACHINERIES

Dokumenten Nr. **DoI001-R 1.0**
 Declaration No.:

Firma / Manufacturer: **Parker Hannifin GmbH**
 Bevollmächtigter / Authorized person: **Jürgen Killius**

Anschrift **Robert-Bosch-Straße 22**
 Address: **77656 Offenburg**
Deutschland

Produkt **ETH: Parker High Force Electro Thrust Cylinder**
 Product:

Serien- / Typenbezeichnung **ETH032; ETH050; ETH080**
 Model / Type:

Seriennummer **Ab 284356-0001**
 Serial No.: **From 284356-0001**

Baujahr **Ab November 2010**
 Year of manufacture: **From November 2010**

Der oben genannte Hersteller / Bevollmächtigte erklärt, dass das Produkt den folgenden grundlegenden Anforderungen der Richtlinie Maschinen (2006/42/EG) entspricht:

The above mentioned Manufacturer / authorized person declare that the product is complying with the following essential requirements of the machinery directive 2006/42/EC:

Anhang I, Artikel / Annex I, Article: 1.1.1, 1.1.2, 1.1.3, 1.1.5, 1.3.1, 1.3.2, 1.3.3, 1.3.4, 1.3.7, 1.4.1, 1.5.4, 1.5.8 & 1.6.1.

Den im Produkthandbuch beschriebenen Sicherheits-, Installations- und Bedienungshinweisen muss Folge geleistet werden.

These products must be installed and operated with reference to the instructions in the Product Manual.

All instructions, warnings and safety information of the Product Manual must be adhered to.

Die unvollständige Maschine darf erst dann in Betrieb genommen werden, wenn festgestellt wurde, dass die Maschine, in die die unvollständige Maschine eingebaut werden soll, den Bestimmungen der Richtlinie Maschine 2006/42/EG entspricht.

The partly completed machinery must not be put into service until the final machinery, into which it is to be incorporated, has been declared in conformity with the provisions of directive 2006/42/EC on machinery.

Die zur Maschine gehörenden speziellen technischen Unterlagen nach Anhang VII Teil B wurden erstellt.

The machinery related special technical documentation according annex VII B has been created.

Der Hersteller verpflichtet sich, die speziellen Unterlagen zur unvollständigen Maschine einzelstaatlichen Stellen auf Verlangen elektronisch zu übermitteln. Die gewerblichen Schutzrechte des Herstellers der unvollständigen Maschine bleiben hiervon unberührt.

The manufacturer commits to transmit, in response to a reasoned request by the market surveillance authorities, relevant documents on the partly completed machinery electronically by our documentation department.

The intellectual rights of the manufacturer of the incomplete machine are not affected.

1.4 Safety instructions

1.4.1. General hazards

General Hazards on Non-Compliance with the Safety Instructions

The subsystem has been designed in accordance with state-of-the-art technical developments and is operationally reliable. If it is not operated by qualified or at least trained personnel or if it is operated improperly or not in accordance with the operating instructions, however, the unit may bear the risk of hazards.

Electronic, moving and rotating components can

- ◆ Danger for life and limb of the operator or third persons and / or
- ◆ cause material damage

If the linear actuator is installed in a machine plant, the safety requirements noted in the operating instructions for that machine must be combined with those described in this manual.

1.4.2. Intended use

The linear actuator has a number of uses including:

Positioning, transporting, feeding, removing, pallet handling, loading, unloading, processing and manipulating as well as testing work pieces or tools.

Since the component can be used in a very wide range of applications, the user is responsible for its use in specific applications.

Please make sure that the mounting of parts or tools will not pose a threat to persons or cause damages to any parts or devices. This also applies, for example, to the case of a broken toothed belt (if existing).

The linear actuator must only be used in areas that are not accessible to persons during operation.

If the linear actuator is used in areas accessible to people, it must be installed in such a manner that no one can be endangered during operation.

1.4.3. Identifying Residual Dangers and Hazardous Areas

If there are still residual dangers present to persons or property from the linear actuator in spite of operating it in a safe manner, the user must make reference to these residual dangers through signs and written rules requiring appropriate procedures.

The following safety signal words are used:

Danger!

Indicates that an imminent hazardous situation may lead to death or serious bodily harm if not prevented using appropriate safety measures.

Warning!

Indicates a potentially hazardous situation which, if not avoided using appropriate safety measures, could result in serious or minor injury.

Caution!

Indicates a potentially hazardous situation which, if not avoided using appropriate safety measures, may result in minor injury or material damage.

Hint

Provides important information about the product, how to handle the product or about the part of the manual to which particular attention must be paid.

1.4.4. Working safely

Heed the Instructions

The information (such as instructions and notes) contained in this manual must be heeded for all work involved in installing, commissioning, setting up, operating, changing operating conditions and modes, servicing, inspecting and repairing the unit.

The manual must be available close to the linear module during the performance of all tasks.

It is impermissible to operate the liner module if it is not in perfectly functional condition.

Operating personnel

The following jobs must only be performed by appropriately trained and authorized personnel:

- ◆ Installation and set-up tasks on the linear actuator
- ◆ Attaching safety limit switches (initiators)
- ◆ Connecting the drive and testing the motion direction

Instructions for Special Hazards

The linear module must be fixed or supported in accordance with the indications in this manual.

The operator must ensure that operation of the linear module does not cause any danger.

If the linear module moves in hazardous areas, these areas can be safeguarded with safety transmitter switches.

1.4.5. Safety Instructions for the Company Using the System

Supervisors must also become familiar with the entire chapter entitled "Safety" and handling required on the linear actuator.

Supervisors must ensure that installation and operating personnel have read and understand the chapter entitled "Safety" and the description of how to work with the machine, and that they observe the instructions.

The manual must be available close to the linear module during the performance of all tasks.

It is impermissible to operate the liner module if it is not in perfectly functional condition.

Depending on the application, the operating company must provide for a suitable separating safety fence. Access to the motion range during operation must be prevented.

The user must make sure that the work area is protected by appropriate safety devices.

1.4.6. Safety Instructions for Operating Personnel

Any work step that has a negative effect on the operating safety of the linear motor module must be omitted.

Operating and supervisory personnel are required to check the linear actuator or machine at least once per shift for externally visible damage or defects. Changes that have occurred (including the operating behavior) that could have a negative effect on the operating safety must be reported immediately.

Components and accessories are designed especially for this product. When purchasing spare and wearing parts, use only original Parker parts. We note here explicitly that we are unable to check or release spare parts or accessories that were not provided by us. Installing and/or using such products may cause negative

changes in the required design properties in some circumstances, which in turn could negatively effect the active and/or passive operating safety of the product. The manufacturer is unable to accept any liability for damage caused by using non-original parts and accessories.

Safety and protection devices are strictly NOT to be removed or bypassed or set out of order.

Applicable requirements and national accident prevention regulations must always be observed when installing and operating our linear motor module.

1.5 Packaging, storage, transport

First check

- ◆ Check the packaging for damages.
- ◆ Remove the packaging.
Do not discard the packaging; it is strongly recommended to use the original packaging material for return deliveries.
- ◆ Depending on the storage location, metal surfaces may have a temperature of 0 °C or below. Please provide appropriate worker protection (e.g. protective gloves).
- ◆ Please ensure that the consignment does correspond to your order.
- ◆ Check the product for damages. Do never use a device which seems damaged.
- ◆ Please read the installation manual carefully before installing or commissioning the device.

Packaging material

The packaging material is inflammable, if it is disposed of improperly by burning, lethal fumes may develop.

Transport

Make sure to transport the linear module always in a safe manner and with the aid of suitable lifting equipment (Means of transport).

Storage

The linear module must be stored evenly and without any mechanical load. The stated storage temperature must be adhered to.

Disposal

We recommend to dispose of the respective materials in accordance with the respectively valid environmental laws. The following table states the materials suitable for recycling and the materials which have to be disposed of separately.

Material	suitable for recycling	Disposal
Metal	yes	no
Plastic materials	yes	no

1.5.1. Special notes on transport

Special notes on transport

Use only transport equipment with sufficient lifting capacity. When using ropes, make certain they are not twisted or knotted. If you are using more than one rope, all the ropes should be equally taut.

When transporting the ETH with a forklift, establish a condition of equilibrium and secure the load if necessary.

Never step under overhead loads - danger of being injured!
Moving parts must always be secured against slipping or moving.

Required minimum load bearing capacity of the means of transport:

ETH032	ETH050	ETH080
130 kg	300 kg	750 kg

In these table values, a safety factor of $S=8$ is taken into consideration (motor and gearbox weight included). This means that it does **not** represent the cylinder weight.

The following threads on the cylinder can be used to mount transport or mounting equipment (for example eye bolts):

Motor inline:

Motor parallel

	ETH032	ETH050	ETH080
DD	M6x1.0	M8x1.25	M10x1.5
JJ*	M6x1.0	M8x1.25	M10x1.5
BH	9	12.7	17.5
BG	16	25	26

* screw "JJ" is not available in IP65 for the ETH32 and the ETH50!

1.6 Warranty conditions

User Conversions and Changes are Not Permitted

The linear actuator must not be changed in its design or in terms of safety without our approval. Any change as defined here made by the user excludes any liability on our part.

1.7 Conditions of utilization

General introductory notes

With the ETH electro cylinder you bought a product which was manufactured and tested before delivery with the utmost care.

Please take your time to read the following notes which you ought to follow closely during setup and operation.

The operation of the electro cylinder is only permitted within the limit values stated in this manual.

Unless, all claims under the warranty will become void and a reduced service life or even damages must be expected.

Please compare the operating data with the stated limit values especially with reference to:

- ◆ Stroke length and setting of the limit switches, those must be set so that there is a sufficient safety travel at both ends of the travel stroke

Even if the limit switches were already mounted at our premises, they must be adapted according to suitable values before operation!

- ◆ Thrust and traction force in the effective direction
- ◆ Lateral force (e.g. as a component of the effective force, but also due to own weight on horizontal mounting, especially with parallel motor mounting and long travel strokes)
- ◆ Speed
- ◆ Acceleration
- ◆ Environmental conditions (e.g. temperature, contamination)
- ◆ Please do take possible pulses caused by moved masses into consideration for the operating data. (Even small abrupt loads can cause damage, especially if they occur rather often at the same place.)

The limit values for the thrust and traction force, lateral force, speed and acceleration are partly influenced by several factors and can change depending on:

- ◆ the size of the electro cylinder
- ◆ Screw lead
- ◆ Direct or parallel drive via toothed belt transmission
- ◆ Mounting method
- ◆ Mounting orientation vertical or horizontal resp. inclined
- ◆ Travel Stroke

If the motor used with the electro cylinder should be able to exceed individual limit values of the cylinder, the respective values for the motor must be limited in the control by appropriate parameterization. The parameterization should even be reduced down to the values necessary for operation. This would, for example provide a hint to a possible damage or to preventive maintenance if wear-induced extensive friction of the machine or cylinder would trigger an error message of the controller.

The internal end stops of the electro cylinder may under no circumstances be accessed during operation. The internal end positions may only be accessed by the cylinder in setup mode and only for determining the end positions with a low force of a few N (torque limitation if possible below 10%) and very slowly (max. 2% of the nominal speed).

The lifetime of the electro cylinder depends strongly on the degree of power exploitation and on impermissible operating states occurring - even if only for a short time.

2. Set-up

In this chapter you can read about:

Mounting.....	13
Electric installation.....	14
Motor and feedback mounting.....	17
Exchanging the toothed belt.....	22
Belt / belt tensions	23

The linear module is furnished completely mounted and mechanically ready-to-operate.

If no Parker drive is provided, attach your motor-gearbox combination according to the instructions of the respective supplier.

The technical data must be respected.

See from page 6 in the catalog section (following the mounting instructions).

2.1 Mounting

Caution!

Please use only the parts offered in the Parker ETH catalog for the following mounting components:

- ◆ Rear Eye Mounting (order code E)
- ◆ Rear Clevis (order code C) with bearing pedestal

Standard parts in accordance with the ISO flange standard cannot be used for these accessories, as they are not sufficiently stable.

Please Note:

- ◆ The cylinder housing must be mounted without tension or contorsion.
- ◆ The cylinder housing must be precisely aligned to the load direction of motion.
- ◆ Occurring lateral forces on the cylinder must be taken into consideration.

2.1.1. Mounting with mounting threads on the cylinder

The easiest and most economic method of mounting is using the available mounting threads on the cylinder body. Make sure that the mounting surface is level and that the cylinder is mounted without tension and contortion. This method of mounting is only possible, if the lower side of the mounting surface is accessible. Dimensions: see in the catalog section (following the mounting instructions) on page 16.

2.1.2. Mounting with mounting accessories

Cylinder mounting with mounting plates or foot mounting brackets

If the underside of the mounting surface is not accessible, mounting plates or foot mounting brackets are available as accessories.

Mounting methods: see from page 19 in the catalog section (following the mounting instructions).

Dimensions: see in the catalog section (following the mounting instructions) on page 16.

The rear mounting plate cannot be fixed with inline motor configuration.

If you fix the cylinder only at the rear end (e.g. also with a rear clevis) please respect the effective direction of the known forces. Critical are above all lateral forces in horizontal or vertical direction.

Permissible side load: See from page 13 in the catalog section (following the mounting instructions).

2.1.3. Mounting notes

2.1.3.1 Side Load

Please respect the maximum permissible side loads depending on the vertical or horizontal mounting position.

Permissible side load: See from page 13 in the catalog section (following the mounting instructions).

2.1.3.2 Mounting of the payload

Connect the payload always with the end of the thrust rod so that occurring lateral forces are minimized. If the payload is separately guided, even minimal deviations between this guiding system and the cylinder length axis can generate high lateral forces and reduce the service life of the electro cylinder considerably.

There are two possibilities to avoid this problem:

- ◆ Use a flexible coupling at the thrust rod end.
This coupling can compensate up to 3 mm axial offset and up to 10° angular offset.
- ◆ Use other thrust rod connection elements (accessories), which are able to compensate certain deviations such as for example rod clevis or spherical rod eye
- ◆ Use a flexible cylinder fixing device (accessories) such as for example rear clevis or center trunnion.

Thrust rod version: see from page 23 in the catalog section (following the mounting instructions).

2.2 Electric installation

2.2.1. Sensors

All electro cylinders feature a permanent magnet in the spindle nut. It activates the limit switches which are mounted in the special mounting grooves on one side of the cylinder.

Sensors and limit switches: see from page 28 in the catalog section (following the mounting instructions).

2.2.2. Sensor mounting

- ◆ Sensors can be inserted in all grooves on the ETH electro cylinder.
- ◆ If no sensors are mounted by the manufacturer (on customer request), please remove the groove protection covers. Use a pointed screwdriver to lever the ends of the covers off the grooves. Pull the entire covers out manually.
- ◆ Install the magnetic cylinder sensors. The sensors can be inserted into the grooves from above. The cable ends should lead into the drive direction. Push the sensors to their approximate positions in the grooves of the cylinder body. Tighten the fixing screws on the limit switches slightly and lead the cable along the profile groove.
- ◆ If **sensors are used as end limits** (see on page 16), do set them.
 - ◆ You can use the formerly removed protective covers in order to fix the sensor cables. Please cut the covers to the desired length with the aid of a pair of scissors. Please cut off an additional 5 to 10 mm, where the cables are to be lead out of the profile.

- ◆ Insert the cables into the grooves of the plastic covers and push the cover into the groove together with the cable.
- ◆ Connect the sensors to the controller.
Sensors and limit switches: see from page 28 in the catalog section (following the mounting instructions).

Sensor mounting example: 2 end limits with machine zero

2.2.3. Direction of the motor during extension of the cylinder

With parallel drive (drawing c), the turning direction of the motor is reversed in comparison with the direct drive configuration!

2.2.4. Setting the end limits

The steps described below can be best executed with energized drive. Therefore, they may only be performed by trained and authorized personnel.

Do only travel at very low speed (<10 mm/s) and reduce the drive torque to a minimum.

Ensure that there are no persons in the hazardous area.

The setting of the end limits depends on the application.

No sensor is to be mounted in the area of the central lubrication port (option).

The following activation positions at the mechanical end limits result from the initiators recommended in the catalog.

ETH		A [mm]	B [mm]
032	M05	68	0
	M10	77	0
	M16	81	0
050	M05	71	0
	M10	77	0
	M20	89	0
080	M05	85	0
	M10	103	0
	M32	133	0

Caution!

Please add the respective safety travels to the values mentioned above”

Stroke, usable stroke and safety travel: see in the catalog section (following the mounting instructions) on page 14.

Sensors and limit switches: see from page 28 in the catalog section (following the mounting instructions).

Adjusting the machine zero proximity switch

The correct position for the home switch (machine zero switch) depends on the application

It is recommended to set the machine zero at or near the end of the travel - this saves time, as it minimizes the chance that the machine zero is searched for in the wrong direction. In some cases it is possible to use one of the limit switches as machine zero, this method provides however a reduced precision, as the resulting position can normally not be and-linked with the encoder index pulse.

2.3 Motor and feedback mounting

In this chapter you can read about:

Motor / gearbox mounting with inline motor configuration.....	18
Motor / gearbox mounting with parallel motor configuration	19

Notes on motor wiring

In order to adhere to the EMC directive, it is necessary to mount the motor if ever possible unchanged. If you require a longer cable, the entire line should be replaced with the same or a similar cable.

If you mount a connector on the new cable, please make sure that the 360 ° motor cable shielding is maintained and that there is no connection to earth via the connector housing.

The motor must be grounded with a separate PE protective lead (green/yellow, cross-section at least 2.5 mm²).

This cable must be connected to the available motor-ground connector or - if there is non available - with a mounting screw. In the latter case, the coloring under the head of the screw must be removed.

If the axis is mounted upright, it must be secured against moving out!

2.3.1. Motor / gearbox mounting with inline motor configuration

Motor / gearbox dismantling

- ◆ Remove motor connector
- ◆ **ATTENTION:** Respect the safety instructions!
- ◆ If you use a gearbox, we recommend to dismount the motor from the gearbox first for reasons of weight.
- ◆ Loosen screws (Pos. 6).
- ◆ Remove motor / gearbox including mounted coupling half with caution.
- ◆ Loosen clamping screw of the coupling half (Pos. 3).
- ◆ Remove coupling half from the motor / gearbox shaft.

Mount motor / gearbox

- ◆ Loosen clamping screw of the coupling half (Pos. 3).
- ◆ Slip the coupling half onto the motor / gearbox shaft and align to be flush with the shaft if not stated otherwise by Parker (Pos. 2).
- ◆ Tighten clamping screw of the coupling half:

Coupling size	Tightening torque
GS12 (Outer diameter: 25 mm)	1.4 Nm
GS14 (Outer diameter: 30 mm)	1.4 Nm
GS19 (Outer diameter: 40 mm)	10.5 Nm

- ◆ Slip motor / gearbox onto the mounted flange.
- ◆ **Attention:** Slip on motor / gearbox with a slight pivoting movement, so that the coupling halves interlock.
- ◆ Arm screws (Pos. 6) with washers (Pos. 7) and tighten.

2.3.2. Motor / gearbox mounting with parallel motor configuration

In this chapter you can read about:

Re-apply toothed belt pre-tension (reinsert the same toothed belt).....	20
Resetting the toothed belt pre-tension (new toothed belt).....	21

Figure 1: Parallel housing

Figure 2: Parallel motor

Motor / gearbox dismantling

- ◆ Remove motor connector

Caution!

Respect the safety instructions!

- ◆ Remove lid (Fig. 1 Pos. 6) and screws (Fig. 1 Pos. 9).
- ◆ Remove lid (Fig. 1 Pos. 4) and screws (Fig. 1 Pos. 11).
- ATTENTION:** Keep all screws and lids for later mounting.
- ◆ Release toothed belt tension:
 - ◆ Slightly loosen 4 screws (Fig. 2 Pos. 7) by 1 or 2 turns (see figure on the right).
 - ATTENTION:** Do not remove the screws entirely!
 - ◆ Loosen central toothed belt tensioning screw (Fig. 1 Pos. 12).
The drive unit must lower slightly when the tensioning screw is loosened.
 - ◆ Loosen tightening screw (Fig. 1 Pos. 12) until the drive unit is not lowered any further.

- ◆ Remove 4 screws (Fig. 2 Pos. 7) completely. First at the bottom, then at the top.

Caution!

Secure drive unit against dropping. We recommend to place a support pad between motor and cylinder profile.

Make sure not to insert your fingers between motor / gearbox and electro cylinder!

- ◆ Remove drive unit with mounted toothed pulley from the parallel housing with caution.
- ATTENTION:** Make sure that the toothed belt is not stuck in the parallel housing.
- ◆ Dismount motor / gearbox flange (Fig. 2 Pos. 3) by loosening the screws (Fig. 2 Pos. 6).
- ◆ Measure and note depth "A" from toothed pulley to motor / gearbox shaft before dismounting the toothed pulley (see figure on the right).
- ◆ Remove threaded pin(s) from the toothed pulley.
- ◆ Pull off toothed pulley with the aid of a pull-off tool,

Motor / gearbox mounting

- ◆ Fit toothed pulley and set dimension "A".
Dimension "A" is provided by Parker. If the drive was exchanged, please set the dimension "A" noted before.
- ◆ Screw in the toothed pulley threaded pins.
- ◆ Mount motor / gearbox flange (Fig. 2 Pos. 3) with the screws (Fig. 2 Pos. 6 and Pos. 8).
- ◆ Insert drive unit with mounted toothed pulley into the parallel housing with caution. We recommend to place a support pad between motor and cylinder profile.
- ATTENTION:** Please make sure that the toothed belt is correctly geared in the pulley toothing.
- ◆ Screw in 4 screws (Fig. 2 Pos. 7) until the motor flange fits. Do not yet tighten.

Caution!

Make sure not to insert your fingers between motor /gearbox and electro thrust cylinder!

- ◆ Setting the toothed belt pre-tension:
 - ◆ For **the used toothed belt** (see on page 20).
 - ◆ For **a new toothed belt** (see on page 21).
- ◆ Mount lid (Fig. 1 Pos. 6) with screws (Fig. 1 Pos. 9).
- ◆ Mount lid (Fig. 1 Pos. 4) with screws (Fig. 1 Pos. 11).

2.3.2.1 Re-apply toothed belt pre-tension (reinsert the same toothed belt)

If the motor / gearbox is exchanged and the toothed belt is still in good condition, the pre-tension can be reset without measuring device:

- ◆ First check, if the belt toothing is geared into the upper and lower toothed pulley.
- ◆ The screws (Fig. 2 Pos. 7) must be inserted (but not tightened), so that the drive unit can be lifted.
- ◆ Tighten central toothed belt tensioning screw (Fig. 1 Pos. 12).
The drive unit must lift when tightening the screw. Lift the unit until it touches the 2 internal stops (fig. 1 Pos. 10). This is made by tightening the central tightening screw.

- ◆ Tighten 4 screws (Fig. 2 Pos. 7) with the given tightening torque.

ETH032	ETH050	ETH080
3 Nm	5 Nm	10 Nm

- ◆ Refix both lids (Fig. 1 Pos. 4 & 6) with the respective screws (Fig. 1 Pos. 11 & 9).

2.3.2.2 Resetting the toothed belt pre-tension (new toothed belt)

For a new toothed belt, we recommend to re-set the toothed belt pretension:

- ◆ Check, if the belt toothing is geared into the upper and lower toothed pulley.
- ◆ The screws (Fig. 2 Pos. 7) must be inserted (but not tightened), so that the drive unit can be lifted.
- ◆ Loosen both lock nuts (Fig. 1 Pos. 14) (do not remove entirely).
- ◆ Unscrew both threaded pins (Fig. 1 Pos. 10) until they are almost level with the inside of the parallel housing.
- ◆ Tighten central toothed belt tensioning screw (Fig. 1 Pos. 12) until the toothed belt is noticeably pretensioned.
- ◆ Measure toothed belt tension with a suitable device.
We recommend: Gates: „Sonic 507c" or Hilger&Kern: „Trummeter"
- ◆ Tighten screw lightly and repeat measurement.
- ◆ Repeat this procedure until the required **toothed belt pretension** (see on page 21, see on page 23) is set.

Caution! Only a correctly set toothed belt pretension ensures fail-safe operation of the cylinder.

- ◆ Screw in both threaded pins (Fig. 1 Pos. 10) until they touch the inner bracket.
Tighten pins slightly.
- ◆ Retighten lock nuts (Fig. 1 Pos. 14).
- ◆ Tighten 4 screws (Fig. 2 Pos. 7) with the given tightening torque.

ETH032	ETH050	ETH080
3 Nm	5 Nm	10 Nm

- ◆ Refix both lids (Fig. 1 Pos. 4 & 6) with the respective screws (Fig. 1 Pos. 11 & 9).

2.4 Exchanging the toothed belt

Figure 1: Parallel housing

Figure 2: Parallel motor

Dismounting the motor (see on page 17)

- ◆ Loosen and remove 4 screws (Fig. 1 Pos. 1).
- ◆ Remove lid (Fig. 1 Pos. 3).
- ◆ Remove bar (Fig. 1 Pos. 5).
- ◆ Remove old toothed belt and insert new belt.

ATTENTION: Please make sure that the toothed belt is correctly geared in the pulley toothing.

- ◆ Insert bar (Fig. 1 Pos. 5).
- ◆ Fit lid (Fig. 1 Pos. 3).
- ◆ Apply screw adhesive "Wiko 02K43 medium" to 4 screws (Fig. 1 Pos. 1) and tighten slightly.
- ◆ Align housing (Fig. 1 Pos. 2) with the electro cylinder.
- ◆ Tighten 4 screws (Fig. 1 Pos. 1) with the given tightening torque.

ETH032	ETH050	ETH080
9 Nm	20 Nm	40 Nm

- ◆ **Mounting the motor** (see on page 17)
- ◆ Setting the toothed belt pre-tension:
 - ◆ For **the used toothed belt** (see on page 20).
 - ◆ For **a new toothed belt** (see on page 21).
- ◆ Mount lid (Fig. 1 Pos. 6) with screws (Fig. 1 Pos. 9).
- ◆ Mount lid (Fig. 1 Pos. 4) with screws (Fig. 1 Pos. 11).

2.5 Belt / belt tensions

	ETH032	ETH050	ETH080
Art. No. Belt	0111.013	0121.013	0131.013
Belt pre-tension	210 N $\pm$ 7 N	230 N $\pm$ 7 N	450 N $\pm$ 14 N
Trum Frequency*	438 Hz $\pm$ 14 Hz	306 Hz $\pm$ 10 Hz	236 Hz $\pm$ 8 Hz
Belt mass	0.060 kg/m	0.080 kg/m	0.120 kg/m
Center distance	67.5 mm	87.5 mm	130 mm

*Alternatively, the frequency for setting the pre-tension can be used.

3. Maintenance

In this chapter you can read about:

Lubricating intervals and amount of lubricant	24
Greasing via central lubrication port (standard).....	24
Relubrication via central lubrication port (option).....	25

The ballscrew drive must be relubricated within given intervals.

The lubrication intervals depend on the operating conditions (nominal size, pitch, speed, acceleration, loads, etc.) and the ambient conditions (e.g. temperature). Ambient influences such as high loads, impacts and vibrations shorten the lubrication intervals.

In short-stroke applications, a lubrication run must be performed after max. 10000 movement cycles.

Lifetime: see from page 10 in the catalog section (following the mounting instructions).

In the event of small loads and if the application is impact and vibration free, the lubrication intervals can be increased. Under normal operating conditions, the given lubrication intervals apply. If the total travel per year is shorter than the given intervals, **the cylinder must be relubricated at least once per year.**

3.1 Lubricating intervals and amount of lubricant

	Screw	Interval	Amount of lubricant
ETH032	M05	300 km	1.3 cm ³
	M10	600 km	1.6 cm ³
	M16	960 km	2.1 cm ³
ETH050	M05	300 km	1.6 cm ³
	M10	600 km	1.9 cm ³
	M20	1200 km	2.7 cm ³
ETH080	M05	300 km	3.1 cm ³
	M10	600 km	4.4 cm ³
	M32	1500 km	7.8 cm ³

Lubricant

Do only use "Klüber NBU15" lubricating grease for standard cylinders!

3.2 Greasing via central lubrication port (standard)

1: Central lubrication (standard)

2: Central lubrication (Option)

- ◆ Make sure that all external stops are removed.
- ◆ Retreat thrust rod completely so that it touches the rear stop.
- ◆ Pass internal buffer by 0.5 mm.

ATTENTION!

Ensure by means of control, that the internal buffer is not passed by more than 0.5 mm!

- ◆ This is the lubricating position.
- ◆ Use a suitable pipe for the funnel type lubricating nipple, Type D1a4 DIN3405: Beaked nozzle.
- ◆ Place the pipe orthogonally onto the lubricating nipple.
- ◆ Use the **defined amount of lubricant** (see on page 24).
- ◆ The amount of lubricant applied can be defined by the number of pump strokes. Pump the stated amount of grease onto a balance, while counting the pump strokes.

3.3 Relubrication via central lubrication port (option)

1: Central lubrication (standard)

2: Central lubrication (Option)

- ◆ Loosen lubrication port screw.
- ◆ Move the cylinder slowly to the lubricating position until the lubricating port becomes visible.
- ◆ The lubricating ports have a diameter of 2.5 mm. Therefore you need a beaked nozzle insert for your lubricating gun.
- ◆ Use a stable pipe (no hose).
- ◆ Insert the nozzle into the hole in the cylinder profile and place it orthogonally onto the lubricating port.
- ◆ Use the **defined amount of lubricant** (see on page 24).
- ◆ The amount of lubricant applied can be defined by the number of pump strokes. Pump the stated amount of grease onto a balance, while counting the pump strokes.

4. Repair

In the event of a damage or a mechanical defect, the entire unit must be returned for repair (**Parker Hannifin** (see on page 2)). The repair must be made by trained Parker personnel.

User Conversions and Changes are Not Permitted

The linear actuator must not be changed in its design or in terms of safety without our approval. Any change as defined here made by the user excludes any liability on our part.

ETH Product Description

Advantages of the New Electro Cylinder:

- Unrivalled power density - high forces and small frame sizes
- Initiators / initiator cables can be concealed in the profile
- Optimized for safe handling and simple cleaning
- High service life
- Reduced maintenance costs thanks to lubricating hole in the cylinder flange
- Easy replacement due to pneumatic ISO flange norm (DIN ISO 15552:2005-12) conformity
- Anti-rotation device integrated
- Reduced noise emission
- All from one source
We offer the complete drive train: Drive controllers, motors and gearboxes matching the Electro Cylinder

Typical Fields of Application:

The ETH electro cylinder closes the gap between pneumatic and hydraulic drives; it is suitable to replace those in many applications and simultaneously increase the reliability of the production process. Taking the costs for air and oil into consideration, you will find that in most cases an electromechanical system such as the ETH electro cylinder offers the more economical solution. Combined with a wide choice of accessories, it offers many possibilities in the following areas of application:

- Material handling and feed systems:
 - Wood and plastic working industry
 - vertical actuators for loading machine tools
 - in the textile industry for tensioning / gripping textile fabrics
 - in the automotive industry for transporting and feeding components
- Testing equipment and laboratory applications
- Valve and flap actuation
- Pressing
- Packaging machinery
- process automation in the food and beverage industry

Technical Characteristics:

For precise motion, positioning, setting and actuating, the electro cylinder offers:

- High mechanical efficiency up to 90 %
- Strokes up to 1600 mm
- High traction/thrust force up to 25 100 N
- Repeatability up to ± 0.03 mm
- Speeds up to 1.7 m/s
- Toothed belt drive (for parallel motor mounting)
- Many different screw pitches for thrusts from 5 to 32 mm/rev.
- 3 different sizes (ETH032, ETH050, ETH080)
additional sizes are planned
- Predefined standardized motor and gearbox flanges for simplified selection. The motors are available directly from Parker (all from one source).
- 3 different protection classes available:
 - IP54 with galvanized screws (standard)
 - IP54 with VA stainless screws
 - IP65

We also offer customized solutions:

If your application requires a special version of the ETH cylinder, please contact us, we shall be pleased to help you.

- Oil splash lubrication
- Customized mountings and rod ends
- Mounting of customer motors
- Preparation of the cylinder for use under aggressive environmental conditions
- Overlong thrust rod
- Polished thrust rod
- Thrust rod hard-chrome plated
-

ETH Electro Cylinder
Parker High Force Electro Thrust Cylinder

Parker High Force Electro Thrust Cylinder

Product Design

Screw support bearing (front end):

The non-motor end of the screw is supported by a hard durometer polymer bushing designed to eliminate vibration while also reducing noise. The result is a quieter, smoother motion with better precision, longer screw life, and increased dynamic behavior.

Precision Ballscrew:

The drive train mechanism in the ETH is a class 7 ballscrew (ISO 3408). The ballscrew design also ensures low frictional resistance for smooth motion over the entire speed range, a longer life product with excellent efficiency, and lower dB ratings. The result is higher speeds and higher force capabilities per package size.

Piston Rod Anti-rotation Guidance:

One of the unique design changes in the ETH is a new anti-rotation device. The high quality, maintenance free polymer bushing offers robust guidance preventing the piston rod from twisting as the rod extends and retracts.

Extruded Cylinder Body:

The extrusion design reduces the number of slots or grooves for a cleaner overall design. The only slots are there for sensor mounting and are easily covered to eliminate any area for debris to be trapped. The result is a cleaner, more environmentally friendly design.

Screw Support Bearing (motor end):

A double stacked set of angular contact bearings allows for high thrust forces in both the extend and retract directions. The result is a design with high force density and minimal clearance when changing directions of motion.

Piston Rod Support Bearing & Protection:

The piston rod is supported by an extra long rod bushing. This bushing braces the rod in all directions allowing for smooth travel with high side loading capabilities. In front of the bearing, the rod wiper will keep the typical contamination out the ETH interior. Also available for more challenging environments is an IP65 version for better ingress protection. The result is a more robust design with high side loading capacities and longer contamination free life.

Home and End of Travel Sensors:

The extrusion is designed for flush mount sensors. The Parker global series limit sensors mount inside the groove and have no affect on the product overall width. Once mounted, the slot cover conceals any sensor cables for a clean, aesthetically appealing design with a minimized volumetric footprint. The a common sensor style across Parker's other series of actuation products (including pneumatics) reduces inventory and spare part complexity.

Easy Lubrication Port:

The integrated lubrication fitting allows for quick, simple, easy access to re-grease ball screw. Optionally the part number allows the port to be located in the center of the extrusion in the event the rear is inaccessible in the machine. The result is reduced down time for product maintenance yielding a higher ROI and a longer product life.

Permanent magnet:

All ETH cylinders are equipped with several permanent magnets integrated into the screw nut. The permanent magnets actuate the sensors, which can be mounted in the longitudinal grooves of the cylinder.

Parallel Motor Options:

For applications where overall length requirements constrict the allowable space, the parallel motor mount is the answer. With flexibility in motor options, motor location, and motor orientation, the ETH is the most user friendly design allowing quick selection of the best solution for the application needs. The result is a smaller overall package with increased force density versus overall length.

High Force Parallel Timing Belt:

The robust toothed belt allows for slip free motion with minimal belt wear. The belt design offers a simple 1:1 ratio as a standard and many other ratios as needed by contacting our applications team. This design has maximized transmittable torque for previously un-attainable thrust forces at higher speeds. The result is a compact, robust, high force cylinder with a long life.

Parallel Belt Tension Design:

The new parallel belt tensioning method allows for precise, repeatable belt tensioning with a quick and easy process. The result is faster installation time and reduced down time.

Technical Data

¹ "Order code" (page 40)

Technical Data apply under normal conditions and only for the individual operating and load modes. In the case of compound loads, it is necessary to verify in accordance with normal physical laws and technical standards whether individual ratings should be reduced. In case of doubt please contact Parker.

Step by Step Selection Process

The following dimensioning steps help you to find the suitable electro cylinder.

Select an electro cylinder using estimated application data. Calculate the actually required application data following the dimensioning steps described below.

If your application's requirements exceed a maximum value, please choose a larger electro cylinder and recheck the maximum values. Perhaps, a smaller electro cylinder can also meet the requirements.

Step	Application data	Dimensioning	With the aid of ...
1	Accuracy, ambient conditions	Check the basic conditions for the use of the ETH in your application.	"Technical Data" (page 6)
2	Required space	Check the space available in your application and choose the motor mounting option: inline or parallel.	"Dimensions" (page 16)
3	Axial forces	Calculation of the axial forces in the individual segments of the application cycle.	"Calculating Required Axial Force" (page 8)
4	Maximum force required	Determination of the maximum required axial force (traction and thrust force)	"Required maximum axial force" (page 9)
		Selection of the cylinder via the maximum axial traction/thrust force (please use the characteristics of your desired motor mounting option: inline or parallel).	"Technical Data" (page 6)
5	Maximum velocity	Selection of the screw lead for the desired cylinder.	"Technical Data" (page 6)
6	Maximum acceleration	Verify maximum acceleration of the unit is not exceeded.	"Technical Data" (page 6)
7	Select stroke	• Determine required stroke from usable stroke and safety travels • select the desired stroke from the list of standard strokes • or, if the desired stroke is not listed: Define the length of the usable stroke in steps of one mm. Caution! Please respect the minimum and the maximum possible stroke	"Stroke, Usable Stroke and Safety Travel" (page 14) "Order code" (page 40) "Technical Data" (page 6)
8	Permissible thrust force taking the buckling risk into consideration	Check the maximum thrust force depending on the stroke and the mounting variant. Maybe your application can also be realized with a different mounting variant allowing to attain the maximum thrust force.	"Permissible Axial Thrust Forces" (page 12)
9	Service life	Determining the service life with the aid of an equivalent axial force, the operational environment (application factor) and the service life diagrams.	"Service life" (page 10)
10	Permissible lateral force	Determine the lateral forces of your application and compare them to the permissible lateral forces (depending on the stroke).	Lateral force (page 13) Diagrams (page 13)
11	Relubricating cycle	Please check, if the required relubricating cycle is suitable for your production environment.	"Relubrication" (page 15)
12	Motor / gearbox	Calculation of the necessary torque to generate the required force at the ETH. Selection of a suitable motor.	"Motor and Gearbox Selection" (page 18)
13	Motor mounting flange	Selection of a suitable motor mounting flange.	"Motor Mounting Options" (page 17)
14	Mounting type	Selection of the electro cylinder mounting method.	"Mounting Methods" (page 19)
15	Cylinder rods	Selection of the cylinder rod end for load mounting.	"Cylinder Rod Version" (page 23)

Calculating Required Axial Force

Formula 1 & 2 below give the mathematical equation for calculating the thrust required to extend or retract the piston rod. With the aid of the axial forces, it is possible to check if the electro cylinder is able to provide the required forces and if the maximum buckling load is respected. The axial forces are also used as the calculation basis for the service life.

Formula symbols (Formula 1-2)

$F_{x,a,j}$	= Axial forces during extension in N
$F_{x,e,j}$	= Axial forces during retraction in N
$F_{x,ext}$	= External axial force in N
$F_{G,ext}$	= Weight force caused by an additional mass in N
$F_{G,Kse}$	= Weight force caused by the cylinder rod end in N
$F_{G,Ks}$	= Weight force caused by the cylinder rod in N
m_{ext}	= Additional mass in kg
m_{Kse}	= Mass of the cylinder rod end in kg (see "cylinder rod versions" page 23)
$m_{Ks,0}$	= Mass of the cylinder rod at zero stroke in kg (see table "Technical Data" page 6)
$m_{Ks,stroke}$	= Mass of the cylinder rod per mm of stroke in kg (see table "Technical Data" page 6)
Stroke	= Selected stroke in m
$a_{k,j}$	= Acceleration at the cylinder rod in m/s^2
α	= Alignment angle in °
$F_{x,max}$	= Maximum permissible axial force in N

Index "j" for the individual segments of the application cycle

Calculation of axial forces:

Determine the axial forces occurring during each individual segment of the application cycle.

Cylinder rod extending:

$$F_{x,a,j} = \left| F_{x,ext} + (m_{ext} + m_{Kse} + m_{Ks,0} + m_{Ks,Stroke} \cdot \text{Stroke}) \cdot (a_{k,j} + \sin \alpha \cdot 9,81 \frac{m}{s^2}) \right|$$

Formula 1

Cylinder rod retracting:

$$F_{x,e,j} = \left| -F_{x,ext} + (m_{ext} + m_{Kse} + m_{Ks,0} + m_{Ks,Stroke} \cdot \text{Stroke}) \cdot (a_{k,j} + \sin \alpha \cdot 9,81 \frac{m}{s^2}) \right|$$

Formula 2

The values $F_{x,a,j}$ and $F_{x,e,j}$ are therefore always positive.

Sample calculation:

Vertical mounting

- ETH50
- Stroke = 500 mm = 0.5 m
- Pitch = 5 mm
- Rod End: External thread
- Trapezoidal velocity course
- Acceleration $a_k = 4 \text{ m/s}^2$
- $m_{ext} = 150 \text{ kg}$
- $F_{x,ext} = 1000 \text{ N}$
- $m_{Kse} = 0.15 \text{ kg}$
- $m_{Ks,0} = 0.15 \text{ kg}$
- $m_{Ks,Stroke} = 1.85 \text{ kg/m}$
- Alignment angle $\alpha = -90^\circ$

Thrust rod moving forth: Mass is moved downwards

Load case: Acceleration

$$F_{x,1} = \left| 1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(4 \frac{\text{m}}{\text{s}^2} + \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 121 \text{ N}$$

Load case: Constant Velocity

$$F_{x,2} = \left| 1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(0 \frac{\text{m}}{\text{s}^2} + \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 484 \text{ N}$$

Load case: Deceleration

$$F_{x,3} = \left| 1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(-4 \frac{\text{m}}{\text{s}^2} + \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 1088 \text{ N}$$

Thrust rod moving back: Mass is moved upwards

Load case: Acceleration

$$F_{x,4} = \left| -1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(4 \frac{\text{m}}{\text{s}^2} - \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 1088 \text{ N}$$

Load case: Constant Velocity

$$F_{x,5} = \left| -1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(0 \frac{\text{m}}{\text{s}^2} - \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 484 \text{ N}$$

Load case: Deceleration

$$F_{x,6} = \left| -1000 \text{ N} + \left(150 \text{ kg} + 0.15 \text{ kg} + 0.15 \text{ kg} + 1.85 \frac{\text{kg}}{\text{m}} \cdot 0.5 \text{ m} \right) \cdot \left(-4 \frac{\text{m}}{\text{s}^2} - \sin(-90^\circ) \cdot 9.81 \frac{\text{m}}{\text{s}^2} \right) \right| = 121 \text{ N}$$

Selection of the Size and Screw Lead

Required maximum axial force

Determine the maximum axial force (page 8) that the electro cylinder must provide.

Preselection of the electro cylinder

Using the calculated force required from page 6, compare the actual ETH specifications to determine which profile size will produce enough force. Once you have determined a profile size, determine that the unit will physically fit in the space allowed by the application (including parallel or in-line motor mounts).

Required maximum velocity

The maximum velocity of the electro cylinder depends on the stroke. With the profile size selected, refer to the critical speed information (page 6) to determine which screw lead works best for the application at the needed stroke length.

When the precise stroke is defined, the velocity must again be verified.

Required maximum acceleration

The maximum acceleration depends on the screw lead and serves as an additional selection criterion for the suitable electro cylinder. It is listed in the "Technical Data" (page 6).

Service life

Nominal service life¹

The nominal service life of the electro cylinder can be determined with the aid of the known forces.

The forces calculated for each individual segment of the application cycle must be summarized into an equivalent axial force F_m ("Calculating Required Axial Force" (page 8)).

Calculation

$$F_m = \sqrt[3]{\frac{1}{s_{total}} (F_{x,1}^3 \cdot s_1 + F_{x,2}^3 \cdot s_2 + F_{x,3}^3 \cdot s_3 + \dots)} \quad \text{Formula 3}$$

If you need the service life as the number of possible cycles, just divide the service life in kilometers by twice the stroke traveled. i.e. Standstill times are not taken into consideration when determining the equivalent axial force (F_m), as $s_i=0$. Caution, do always consider the stroke as well as the return stroke.

Actual service life

The actual service life can only be approximated due to a variety of different effects. The nominal service life L calculation does, for instance, not take insufficient lubrication, impacts and vibrations into consideration. These effects can however be estimated with the aid of the application factor f_w .

The actual service life is calculated as follows:

$$L_{fw} = \frac{L}{f_w^3} \quad \text{Formula 4}$$

Application factor f_w

Movement cycle	Shocks/vibrations			
	none	light	medium	heavy
More than 2.5 screw rotations	1.0	1.2	1.4	1.7
1.0 to 2.5 screw rotations* (short stroke applications)	1.8	2.1	2.5	3.0

* After max. 10 000 movement cycles, a lubrication run must be performed (see lubrication run intervals table).

Boundary conditions for application factor f_w :

- Externally guided electro cylinders
- Accelerations $<10 \text{ m/s}^2$
- Application factor <1.5

For other conditions, please contact Parker.

Lubrication run lengths for short stroke applications

Lubrication run lengths	[mm]	ETH032			ETH050			ETH080		
		M05	M10	M16	M05	M10	M20	M05	M10	M32
		>45	>54	>58	>40	>46	>58	>47	>65	>95

Prerequisites for nominal service life

- Bearing and screw temperature between 20°C and 40°C .
- No impairment of the lubrication, for example by external particles.
- Relubrication in accordance with the specifications.
- The given values for thrust force, speed and acceleration must be adhered to at any rate.
- No approaching the mechanical end stops (external or internal), no other abrupt loads, as the given maximum force of the cylinder may never be exceeded.
- The given lateral forces applied to the cylinder rod must always be respected.
- No high exploitation of several power features at a time (for example maximum speed or thrust force).
- No regulating oscillation at standstill.

Abbreviations used (formula 3-4)

- F_m = Equivalent axial force in N
- $F_{x,j}$ = Resulting axial force in N (see formula 1 & formula 2, page 8)
- s_j = Travel given a defined force $F_{x,a,j}$ in mm
- s_{total} = Total travel in mm
- L = Nominal service life in km (see "service life" diagrams page 11)
- L_{fw} = Service life respecting the application factor in km
- f_w = Application factor (see table "application factor" page 10)

Index "j" for the individual segments of the application cycle

¹The nominal service life is the service life reached by 90 % of a sufficient number of similar electro cylinders until the first signs of material fatigue occur.

Diagrams

The given values apply when adhering to the recommended lubrication intervals (see relubrication)

ETH032

ETH050

ETH080

Permissible Axial Thrust Forces

Limited by buckling risk, depending on the stroke and the mounting method; traction forces do not pose any buckling risk. Please check if the maximum axial force (page 8) is possible with the planned mounting method and for the desired stroke.

Permissible Side Load

The electro cylinder features a generously dimensioned cylinder rod and screw nut bearing in the form of high-quality plastic sliding bushings to absorb the lateral force. Please note that electro cylinders with a longer stroke permit a higher lateral force at the same extension length. It may therefore be useful to choose a longer stroke than

required for the application in order to increase the permissible lateral force.

If the permissible lateral forces are exceeded or if the maximum axial force occurs at the same time, the optional outrigger bearing (option R) must be used.

The diagrams apply for a medium travel speed of 0.5 m/s, an ambient temperature of 20 °C and all housing orientations.

Stroke, Usable Stroke and Safety Travel

Calculation

Stroke:

The stroke to be indicated in the order code is the mechanically maximal possible stroke
Stroke between the internal end stops.

Usable stroke:

The usable stroke is the distance which you need to move in your application. It is always shorter than the stroke.

Safety travel (S1 & S2):

The safety travels are required to slow down the cylinder after it has passed a limit switch, Emergency stop in order to avoid contact with the mechanical limit stops.
Depending on the screw lead and the

maximum speed, the following diagram recommends a minimum safety travel, which is sufficient for most applications according to experience. With demanding applications (great masses and high dynamic), the safety

travel has to be calculated and enlarged accordingly (dimensioning on demand).

Diagram

Info:

The safety travel taken from the diagram applies for one side. I.e. the diagram value must be multiplied by factor 2 in order to get the total safety travel.

Relubrication

All frame sizes include a standard Easy lubrication port (designated by ordering code page 40).option 1), modifications for hole placement can easily be accommodated too.

Contact factory for special needs.

- 1: Central lubrication (standard)
2: Optional lubrication (possible on all 4 sides);
 L_p : Length of profile

Option 1: Central lubrication (standard)

Relubrication is simple with the easy access port. Users simply perform a controlled retract of the cylinder approaching the endstop under slow speed and grease the cylinder. The standard easy access port is always at the 3 o'clock position.

Option 2...5: Middle lubrication via an opening in the profile

If a space constraint does not allow easy access to the standard lubrication port, other options in the part number configuration allow for a port at the center of the extrusion. Free access to this bore even after integration of the cylinder into a system can be ensured by choosing the corresponding profile orientation (see order code page 40). The bore is located exactly in the middle of the aluminum profile.

Lubrication intervals

The lubrication intervals depend on the operating conditions (nominal size, pitch, speed, acceleration, loads, etc.) and the ambient conditions (e.g. temperature). Ambient influences such as high loads, impacts and vibrations shorten the lubrication

intervals. In the event of small loads and if the application is impact and vibration free, the lubrication intervals can be increased.

Under normal operating conditions, the given lubrication intervals apply. If the total travel per year is shorter than

the given intervals, the cylinder must be relubricated at least once per year. The lubricant used is supplied by Klüber; it is available worldwide.

Normal operating conditions:

- Medium screw velocity 2000 min⁻¹
- Operating factor $f_w=1.0$
- No impacts and vibrations

ETH032			ETH050			ETH080		
M05	M10	M16	M05	M10	M20	M05	M10	M32
300 km	600 km	960 km	300 km	600 km	1200 km	300 km	600 km	1500 km

Different operating conditions will shorten the lubrication intervals. In the event of small loads and if the application is impact and vibration free, the lubrication intervals can be increased. Under normal operating conditions, the given lubrication intervals apply. If the total travel per year is shorter than the given intervals, the cylinder must be relubricated at least once per year.

Additional motor mounting options on request

Motor and Gearbox Selection

Drive torque calculation

The torques to be produced by the motor result from the acceleration, the load and the friction torque. The drive torques must be calculated for all segments of the application cycle (represented by index "j").

Calculation of the **acceleration torque** with respect to the rotary moments of inertia:

$$M_{B,j} = \left((J_{i/p,0} + J_{i/p,Stroke} \cdot Stroke) \cdot \frac{1}{\eta_{ETH}} \cdot \frac{1}{i_G^2 \cdot \eta_G} + J_G + J_M \right) \cdot 10^{-3} \cdot \frac{6,28 \cdot a_{K,j}}{P_h}$$

only with gearbox

Formula 5

The acceleration forces due to the translatory moved masses are taken into consideration in the calculation of the axial forces on page 8.

The **load torques** result from the occurring axial forces:

$$M_{L,j} = \frac{F_{x,a/e,j}}{\text{Thrust force factor}} \cdot \frac{1}{i_G^2 \cdot \eta_G}$$

only with gearbox

Formula 6

The motor must therefore generate the following drive torques:

$$M_{M,j} = M_{B,j} + M_{L,j}$$

Formula 7

The **effective torque** can be deduced from the drive torques for all segments of the application cycle (formula 7):

$$M_{eff} = \sqrt[2]{\frac{1}{t_{total}} \cdot (M_{M1}^2 \cdot t_1 + M_{M2}^2 \cdot t_2 + \dots)}$$

Formula 8

Motor dimensioning

- The nominal torque of the motor must exceed the calculated effective torque (formula 8).
- The peak torque of the motor must exceed the maximum occurring drive torque (formula 7).

With the aid of the "motor mounting options" chart you can check if the respective motor is mechanically compatible to the corresponding electro cylinder.

Abbreviations used (formula 5-8)

$M_{B,j}$	= Variable acceleration torque in Nm
$J_{i/p,0}$	= Red. rot. mass moment of inertia at zero stroke for inline/parallel motor configuration in kgmm ² (see "Technical Data" page 6)
$J_{i/p, stroke}$	= Red. rot. mass moment of inertia per mm of stroke for inline/parallel motor configuration in kgmm ² (see "Technical Data" page 6)
Stroke	= Selected stroke in mm
η_{ETH}	= Efficiency of the electro cylinder 0.9 (inline drive configuration) 0.81 (parallel motor)
i_G	= Gearbox ratio
η_G	= Efficiency of the gearbox (see gearbox manufacturer specifications)
J_M	= Motor mass moment of inertia in kgmm ² (see motor manufacturer specifications)
J_G	= Gearbox mass moment of inertia in kgmm ² (see gearbox manufacturer specifications)
$a_{K,j}$	= Acceleration at the cylinder rod in m/s ²
P_h	= Screw pitch in mm
$M_{L,j}$	= Load torque in Nm
$F_{x,a/e,j}$	= Loads in x direction in N (see page 8)
$M_{M,j}$	= Drive torque in Nm
M_{eff}	= Effective value - motor in Nm
t_{total}	= Total cycle time in s
t_j	= Amount of time in the cycle in s

Force constant "Technical Data" see page 6.

Index "j" for the individual segments of the application cycle

Mounting Methods

Accessories

Force Sensors

Joint head with integrated force sensor

Swivel heads are important construction components with respect to rotary, pivoting and tilting movements. Force measurements are more and more frequently required in those applications.

The force transducers are suitable for direct mounting on the cylinder rod. They can, for example, be used to measure contact forces or overloads. Thanks to the thin film technology, the swivel head force transducers are very robust and long time stable. An integrated amplifier emits an output signal of 4 ... 20 mA.

The sensors correspond to the EN 61326 standard for electromagnetic compatibility (EMC) and are sized to pick up traction/thrust forces.

Features

- Measuring range:
Traction/thrust forces up to ± 25 kN
- Thin film implants (instead of conventional bonded foil strain gauges)
- Corrosion resistant stainless steel version
- Integrated amplifier
- Small temperature drift
- High long term stability
- High shock and vibration resistance
- For dynamic or static measurements
- Good repeatability
- Simple mounting

Connection of the force sensors to Compax3 is possible on request.

Force sensors

Rear clevis with force sensor

In some force measurement applications, a force sensor on the cylinder rod is not possible or will affect the application's scope. For this case, we developed a special variant of the ETH cylinder, where the force sensor is integrated into the rear end of the cylinder. The advantage is that the sensor cable does not move with the rod. All force sensors are configured as traction/thrust sensors. Analog standard output signals 4...20 mA are available. The sensors correspond to the EN 61326 standard for electromagnetic compatibility (EMC).

Features

- Measuring range:
Traction/thrust forces up to ± 25 kN
- Thin film implants (instead of conventional bonded foil strain gauges)
- Corrosion resistant stainless steel version
- Integrated amplifier
- Small temperature drift
- High long term stability
- High shock and vibration resistance
- For dynamic or static measurements
- Good repeatability
- Simple mounting

Connection of the force sensors to Compax3 is possible on request.

Initiators / Limit Switches

Sensors

The position sensors can be mounted in the longitudinal grooves of the cylinder body and are directly immersible in the profile; projecting edges are thus avoided. The initiator cable is hidden under the yellow cover. The permanent magnet integrated into the screw nut actuates the sensors. Fitting sensors available as accessories.

ETH032, ETH050 2 grooves each on 2 opposite sides.
ETH080 2 grooves each on all sides.

The following initiator types are available for the ETH cylinder series:

PNP Sensor (P8S-...)

NPN Sensor (P8S-...)

Info: Do only use PNP types for ETH with Compax3.

Drive Train Selection

Example for Dimensioning with Predefined Drive Trains

In order to simplify the dimensioning process for a complete drive train, we prepared an overview of predefined electro cylinders, gearboxes, motors and servo drives, which can be found on the following pages. With a few parameters, you can directly find the order code for the required components.
Please respect the boundary conditions!

The following application parameters are required:

- The equivalent axial force.
(Calculation page 10 formula 3 with the forces determined as described on page 8).
- The maximum speed.

Working with the drive train table

- Select the drive trains providing the required axial force (e.g. by drawing a vertical line).
- Then select from this choice the drive trains, that are able to travel at the required speed (e.g. by drawing a second vertical line).
- The suitable drive train can then be selected from the remaining range, if necessary by comparing additional characteristics.

Please check if all given characteristics (such as max. acceleration, supply voltage etc.) are suitable for your application.

Example:

Required data

Equivalent axial force: 5000 N
Speed: 300 mm/s

Predefined Motion Packages for ETH032

In order to simplify the representation, we assumed boundary conditions which must be adhered to without exception in your application, otherwise the product combinations suggested here might not work. In this case, the application must be dimensioned conventionally.

Boundary conditions:

- Stroke from 50 to 400 mm
- Horizontal movement
- The characteristics of the individual components are not to be exceeded, e.g.
 - for parallel drive: transmissible torque depending on the motor speed n must be respected
 - permissible axial thrust forces must be respected
 - Ambient conditions
 - ...
- Linear acceleration
- Maximum acceleration given = deceleration times
- Application factor = 1.0
- The calculation is based on the assumption: without standstill time (i.e. if there are standstill times in the application, only the power reserve is increased)
- 40 °C ambient temperature, with gearbox 20 °C ambient temperature
- up to 1000 m above sea level

Order codes:

bold: mandatory so that the package is combinable.

italics: recommended/standard

blue: must be selected depending on the application.

Hint: The examples shown here are meant to help with the dimensioning process. As many parameters interact in this kind of drive package, the examples make no claim to be complete.

Predefined Motion Packages for ETH050

In order to simplify the representation, we assumed boundary conditions which must be adhered to without exception in your application, otherwise the product combinations suggested here might not work. In this case, the application must be dimensioned conventionally.

Boundary conditions:

- Stroke from 50 to 600 mm
- Horizontal movement
- The characteristics of the individual components are not to be exceeded, e.g.
 - for parallel drive: transmissible torque depending on the motor speed n must be respected
 - permissible axial thrust forces must be respected
 - Ambient conditions
 - ...
- Linear acceleration
- Maximum acceleration given = deceleration times
- Application factor = 1.0
- The calculation is based on the assumption: without standstill time (i.e. if there are standstill times in the application, only the power reserve is increased)
- 40 °C ambient temperature, with gearbox 20 °C ambient temperature
- up to 1000 m above sea level

✓	✓	✓				M10			
✓	✓	✓				M16			
✓						M20			
	✓					M32			
		✓							
Motor mounting position & profile orientation & groove orientation ¹⁾									
	Inline + groove for initiator 3 & 9 o'clock (standard)						A		
	Inline + groove for initiator 6 & 12 o'clock						B		
	Parallel 12 o'clock / groove for initiator 3 & 9 o'clock						C		
	Parallel 12 o'clock / groove for initiator 6 & 12 o'clock						D		
	Parallel 3 o'clock / groove for initiator 3 & 9 o'clock						E		
	Parallel 3 o'clock / groove for initiator 6 & 12 o'clock						F		
	Parallel 6 o'clock / groove for initiator 3 & 9 o'clock						G		
	Parallel 6 o'clock / groove for initiator 6 & 12 o'clock						H		
	Parallel 9 o'clock / groove for initiator 3 & 9 o'clock						J		
	Parallel 9 o'clock / groove for initiator 6 & 12 o'clock						K		
1) ETH080 features 2 grooves each on all 4 sides (i.e. Code B=A or D=C), therefore Codes A, C, E, G, J are possible for ETH080.									
Relubrication option ^{2) & 3)}				Combination with motor mounting position, housing orientation, groove orientation					
				ETH032	ETH050	ETH080			
No additional relubrication hole (standard) (not with 3 o'clock motor mounting)				A, B, C, D, G, H, J, K	A, B, C, D, G, H, J, K	A, C, E, G, J		1	
Relubricating hole centered in the profile 12 o'clock				A, C, E, G, J	B, D, F, H, K	A, C, E, G, J		2	
Relubricating hole centered in the profile 3 o'clock				B, D, F, H, K	A, C, E, G, J	A, C, E, G, J		3	
Relubricating hole centered in the profile 6 o'clock				A, C, E, G, J	B, D, F, H, K	A, C, E, G, J		4	
Relubricating hole centered in the profile 9 o'clock				B, D, F, H, K	A, C, E, G, J	A, C, E, G, J		5	
2) With parallel configuration, the motor may block access to the sensors and the lubrication port. This depends on the motor mounting position.									
3) When selecting the relubrication options 2-5, the standard lubrication port is without function.

WARNING – USER RESPONSIBILITY

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

- This document and other information from Parker-Hannifin Corporation, its subsidiaries and authorized distributors provide product or system options for further investigation by users having technical expertise.
- The user, through its own analysis and testing, is solely responsible for making the final selection of the system and components and assuring that all performance, endurance, maintenance, safety and warning requirements of the application are met. The user must analyze all aspects of the application, follow applicable industry standards, and follow the information concerning the product in the current product catalog and in any other materials provided from Parker or its subsidiaries or authorized distributors.
- To the extent that Parker or its subsidiaries or authorized distributors provide component or system options based upon data or specifications provided by the user, the user is responsible for determining that such data and specifications are suitable and sufficient for all applications and reasonably foreseeable uses of the components or systems.
